-----------------	--

2. Business Objective

Some of the business objectives identified for ACME ERP are:

- ✓ A total solution that manages employees, salaries, customers, suppliers, payroll operations, financial accounting, inventory. etc
- ✓ Set up a professional workflow
- ✓ Allow several user types with different permissions and views
- ✓ Content management system that ensures information reuse and elimination of redundant processes
- ✓ More effective data integration should be maintained
- ✓ Access the right organization information while maintaining integrity and security
- ✓ Effective storage of business critical information enabling the users to make better-informed decisions
- ✓ Provide a scalable features with easy implementation and better content partnerships

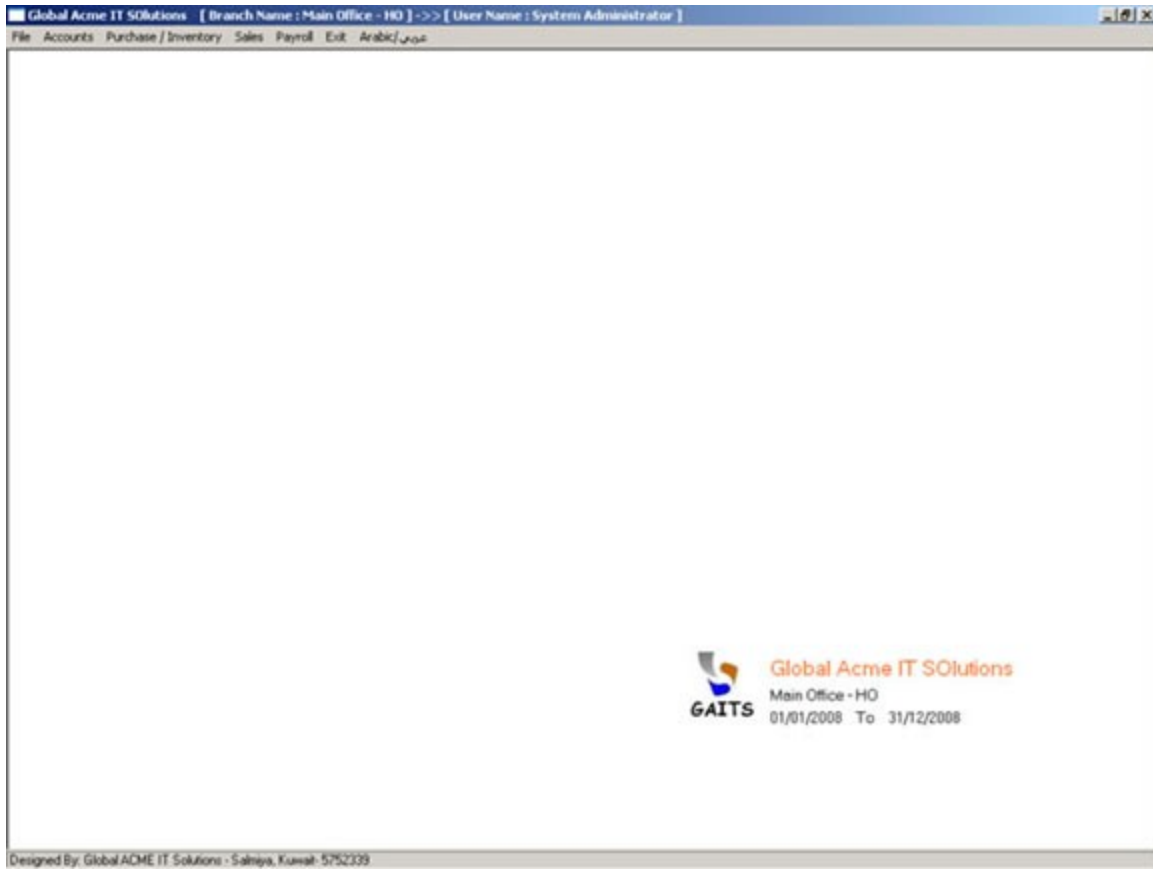

3. Scope of work

The modules of the ACME ERP system are explained in Sections 4-8. The ACME ERP technology is based on Sybase PowerBuilder as front-end and Microsoft SQL Server as the back it (client-server). This means that the company will have the following feature

- Multiple branches can log into the main database.
- No limit to the number of users who can log in.
- No threat of a corrupted database.
- No limit to the amount of data.

ACME ERP is locally designed and implemented by our company for the **Full Customization** according to the requirement analysis. It consists of the following modules:

1. Security, Administration and Company settings Module
2. Finance and Accounting Module
3. Purchasing and Inventory Module
4. Sales Module
5. Pay Roll Module

4. GAITS Enterprise Resource Planning system (ERP system)

File Module: Consists of entries to change some basic company settings, create new branches, new users and give them various rights to access menus

- Automatic price calculation based on the percentage you specify.
- Database backup utility.
- User creation, assigning menu rights like accessing entries and giving user rights like adding and modifying the entries.
- Option to specify the starting serial numbers of the various entries.

Accounts Module: This module maintains all the accounting details of the company, including the customer outstanding. This module is integrated with all other modules, hence all commercial transactions are automatically updated here.

Purchase / Inventory Module: This module generates the purchase order of items, goods received notes, purchase return and number of reports

like purchase order register, purchase register, purchase discrepancy register, pending purchase order register, purchase return register, etc. Different purchase price for particular items can be maintained for different suppliers. This module is combined with Inventory.

In Inventory you have stock transfer entry for transfers from one branch to another, stock adjustment entry and reports like stock movement, item analysis, item status, etc.

Sales Module: Sales is the key process in any organization. In any business, there will be two types of sales namely cash sales and credit sales. Taking this into consideration, our Acme software has been built accordingly with graphical sales report.

Payroll Module: Tracking of employee documents and details, beginning from the Appointment to the retirement. This includes loan, allowance and overtime calculations and built-in ministry formats

5. File Module
